EX2 - HTML

Creation and Uploading of an HTML Page to a Server

Choose a concept that you like (e.g., cats, sports, etc.) and create an HTML page about it.

You should submit:

- The URL to the page.
- Your names if you are doing it with a partner (The exercise can be done in pairs).

Instructions:

Create a new HTML file and name it `ex2.html`.
Build an HTML page using the `<html>`, `<body>`, and `<head>` tags.
Add a title using the `<title>` tag.
Add a favicon using the appropriate tag.
Add content to the page. Use each of these tags:
- `<h1>` (or any other heading tag)
- `<a>` - Add a link to another page, like Wikipedia or any other page (ensure the link works properly).
- `<img>` - The image should display correctly.
- `<ul> <li>` - Add a list.
- `<p>` - Add a paragraph with text.
Upload it to your server in the public directory (`/var/www/html`).
Submit the URL to the page and your names (if you are doing it with a partner).

The link should look like `http://185.28.153.76/ex2.html` (replace the IP with your server's IP).

Ensure your link is working properly before you send it. Check that the HTML is correct, the link is working, the image displays correctly, and all tags are closed properly. It is also recommended to check it from a phone's browser.
